

Modeling the World

Jim Little

Work by Matthew Brown and
Don Murray

Motivation

- An agent needs a map to reason about actions
- Where am I? localization aids the agent to begin reasoning with its location in the map
- The map itself is an important artifact for use by others: stereo gives shape data, images

Navigation

- Vision based
- Build occupancy grid map of static features in the environment (using stereo)
- Path planning on grid
- Detect dynamic obstacles using stereo and bump sensors
- Update map and re-plan

Occupancy Grid Map Example

White : Empty space

Black: Obstacles

Grey: Unknown space

We refer to this map as the plan map

Avoiding Dynamic Obstacles

- Vision (while in translation)
 - if obstacle detected
 - Stop and signal supervisor
 - If obstacle persists over N number of seconds
 - Update plan map, re-plan and continue
- Bump
 - if obstacle detected
 - Stop and signal supervisor
 - Update plan map, re-plan and continue

Finding People

- Construct occupancy grid probability map of where people are standing
- Use the map to decide where to serve next
- Detect people using skin color segmentation
- Use stereo data to compute 3D position of people
- Project locations to floor plane
- Decrease the probabilities over time because people move around

Finding People (Cont.)

Example

Color Image

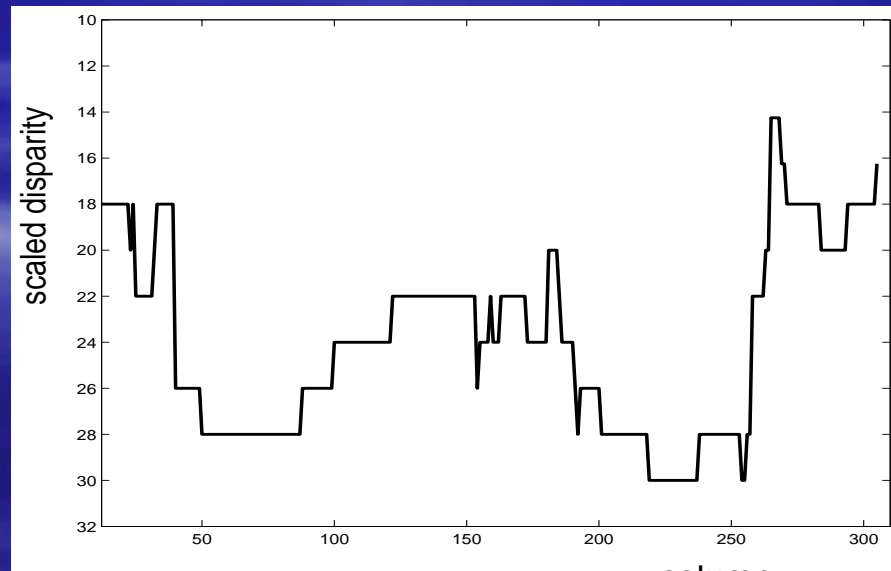

Skin Regions

Probability Map

From stereo to maps

Patchlet Surface Representation

- Trying to properly interpret the uncertainty of stereo measurements in surface reconstruction.
- The sensor elements considered are local patches in the stereo image that create patchlets.
- These patchlets are fit to a plane and the uncertainty of the plane in orientation and position is determined from the stereo 3d points.

Brightness and Depth

Depth Pixels and Scale

Patchlet Uncertainty

Patchlets

Recognizing Panoramas

- Matthew Brown and David Lowe
- Recognize overlap from an unordered set of images and automatically stitch together
- SIFT features provide initial feature matching
- Image blending at multiple scales hides the seams

Panorama of our lab automatically assembled from 143 images

Multiple panoramas from an unordered image set

Input images

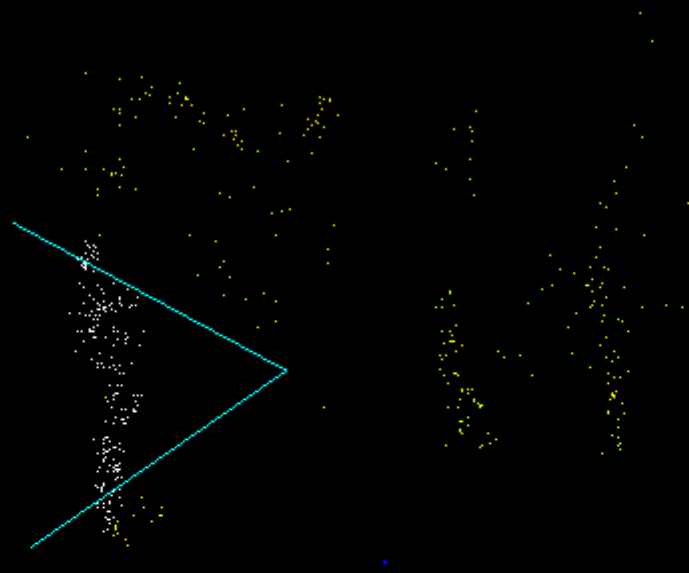

Output panorama 1

Volumetric Images

- The green regions are those grid cells that have occupancy of 60% or more. The floor is the usual occupancy grid map generated using the volume maps. The black pixels represent occupied regions where at least one cell on the volume above it is occupied. If none is occupied then the pixel is set to white i.e., empty space. The blue lines represent the field of view.
- The robot was looking at a wall and a desk with computers to its right.
